

Optimization of Chemical Vapor Synthesis of Oxide Nanoparticles

Filesize: 1.89 MB

Reviews

These kinds of pdf is every thing and helped me searching ahead and much more. It generally does not expense an excessive amount of. You wont sense monotony at at any time of your time (that's what catalogs are for regarding should you question me).
(Prof. Angelo Graham)

OPTIMIZATION OF CHEMICAL VAPOR SYNTHESIS OF OXIDE NANOPARTICLES

Cuvillier Verlag Mai 2011, 2011. Taschenbuch. Condition: Neu. Neuware - The quality and application of nanostructured materials are strongly related to particle and powder characteristics. Powders of small particle size, narrow size distribution, low degree of agglomeration and high purity are typically required for the fabrication of solid nanocrystalline materials and the exploitation of size effects in applications. Chemical vapor synthesis (CVS) is a method for the generation of nanoparticles in the gas phase. Process parameters (temperature, pressure, residence time, precursor concentration, etc.) play an important role. In this work it is shown for TiO₂ that the way in which energy is supplied to the reactor and the time-temperature history which the particles experience have substantial influence on the particle generation and powder characteristics. The degree of agglomeration can be decreased by using high process temperatures and high quenching rates. A novel method, pulsed precursor delivery using a laser flash evaporator, was developed to feed precursors into a CVS reactor. The degree of particle agglomeration can be significantly reduced by pulsed precursor delivery. The volatility of precursors used in CVS can limit the number of possible material systems which can be produced as well as their production rate. It is shown that these limitations can be overcome by the use of a laser flash evaporator, which enables the production of complex oxides such as Co-doped and Co, Li-doped ZnO. A high solubility of Co in ZnO, where Co is substituting Zn in the wurtzite lattice is achieved. This is the key requirement for the development of dilute magnetic semiconductors based on Co-doped ZnO. 124 pp. Englisch.
