Reviews

An exceptional ebook along with the typeface utilized was fascinating to read through. I am quite late in start reading this one, but better then never. You are going to like the way the blogger write this publication.

Condition: New. Publisher/Verlag: LAP Lambert Academic Publishing | Electrophysiological Assessment by Means of Advanced EMG Techniques | The aim of this work was to systematically investigate the neuromuscular adaptations to distinct motor training programs, such as endurance and strength training, with particular emphasis on the neural mechanisms. To achieve this purpose different electrophysiological techniques were combined and applied, which allowed to concurrently assess both central and peripheral adaptations to specific motor training programs. Information on the discharge rate patterns was extracted from the intramuscular signals by employing digital signal processing and pattern recognition techniques. Based on this data, the present work showed that endurance and strength training elicits opposite adjustments in the spinal cord output. These distinct changes seem to match the divergent motor output expected for the two training programs. Endurance training increases resistance to fatigue and is accompanied by decreased motor unit discharge rates. In contrast, strength training enhances maximum force output and is accompanied by increased motor unit discharge rates. These distinct adjustments in the spinal cord output result from changes in different neural mechanisms located at supraspinal or spinal level. | Format: Paperback | Language/Sprache: english | 165 gr | 220x150x6 mm | 112 pp.
