Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1918 Excerpt: .strange characteristic of magnetism is that it may be made to exist to any considerable extent in only a comparatively few materials. These are called ferro-magnetic materials, and in this class may be placed the metals iron and nickel, and the minerals magnetite and franklynite. No satisfactory explanation can be given to this peculiarity, as it is not completely understood. For the purpose of this discussion, it is sufficient to say that magnetism is probably due to an arrangement of the atoms or molecules into forms that can be assumed by only a comparatively few materials. It is not due to a chemical change, and the magnetic properties of a material can no more be determined chemically than can color or hardness. In order to determine whether or not gravity concentration of any material is possible, specific gravity determinations may be made, and likewise, in order to determine whether or not magnetic concentration is possible, magnetic permeability determinations may be made. With the above comparisons between magnetism and gravity in mind, it is easily understood that magnetic concentration offers a simple method for the separation of the few ferro-magnetic minerals. The iron oxide, magnetite, comes within this group and it is, therefore, a comparatively simple matter to remove the magnetite from an ore after it has been crushed sufficiently fine to free the particles of magnetite from the gangue. Unfortunately, however, a large proportion of the low-grade ore found in the Lake Superior district is not..
