This book will be worth getting. Better then never, though i am quite late in start reading this one. Its been written in an extremely basic way which is only right after i finished reading this book through which actually altered me, alter the way i believe.

Not illustrated. 1869 Excerpt: . . . thrust of the lower flange against the abutment is equal and opposite to the pull of the upper flange, so that they form a couple whose tendency is to overturn the abutment on its lower edge next the weight. 149. Strains In braced webs may be deduced from shearingstraln. --When the flanges are parallel and the bracing consists of a single system of triangulation, the strain in any brace is equal to the shearing-strain multiplied by secO. Hence the strains in the bracing might be deduced from the shearing-strain in the web calculated in the manner explained in Chap. II. (14, 18). The method of the resolution of forces just described is, however, better calculated to give a correct perception of the properties of diagonal bracing, and it has moreover the advantage of being applicable to lattice girders as well as those whose bracing consists of a single system of triangles. See the table in 236 for the numerical values of the tangents and secants of different angles. 1SO. Web. --Let W the weight of so much of the load as covers one bay, i. e. , the weight resting on each apex of the loaded flange (146), n the number of these weights between any given diagonal and the outer end of the girder, 2 the strain in the given diagonal, F the strain in any bay of either flange, B the angle which the diagonals make with a vertical line. W The weight on...
