One is not accustomed, in wireless telegraphy, to look upon the blue spark as being the oscillating spark, and I venture to ask how they know that this is really the oscillating part of the discharge, and whether, when they say oscillating, they mean oscillating in the sense we use it in wireless telegraphy I should also like to ask what the authors mean in Fig. 22--the curves between frequency in cycles per second and the current in the primary in amperes--in which resonance points are given on the curves. The usual meaning of the word resonance is correspondence in frequency between the exciting source and the circuit that is able to swing--between the periodic force and the oscillating body. I should like to know what was the periodic force here. Was it the frequency of the alternating supply that was resonated at point A on the 10 lbs. per square inch curve, or what was it It seems to me that, in the discharges that Mr. Cramp is working with, we can possibly have two frequencies. First of all, there is the frequency of the supply. Secondly, there is the frequency of the interruptions of the sparking across the gaps; because the spark can occur across the gap between the electrodes more...
