It is just one of my personal favorite publications. It is among the most awesome publications I have read. It is extremely difficult to leave it before concluding, once you begin to read the book.

Not illustrated. 1893 Excerpt: . are attained, it is necessary to consider the laws of multiplication of quaternions: and, in doing so, it is not necessary to consider the stretching part (or Tensor) of the quaternion--for that part is a mere number and so obeys all the laws of ordinary algebra. We may represent quaternions by plane angles or by arcs of great circles on a unit sphere. Thus, if PQR be a spherical triangle whose sides p , q , r are portions of great circles on the unit sphere, the quantities p , q , r may represent the corresponding quaternions. Let a be the vector from the origin to the point Q. Then pa is the vector to the point R, and $q-pa$ is the vector to P. But this is also ra , if r is measured from Q to P while p and q are measured from Q to R, and from R to P, respectively. And we are at liberty to define $r = qp$, so that $q-pa = qpa$. This makes the associative law hold when a , pa , and qpa are vectors--a fact which is pointed out by Hamilton, Lectures, 310, and by Tait, Elements, 54. It defines quaternion multiplication. Various proofs that the associative law holds in the multiplication of quaternions have been given. Of these, Hamilton's proof (Lectures, 296; Elements, 270; and Tait's Elements, 57-60) by spherical arcs and elementary properties of spherical conics involves, by definition, the particular assumption of association just alluded...
