Springer. Paperback. Condition: New. 361 pages. Dimensions: 11.5in. x 8.2in. x 0.9in. The flow of two-phase mixtures through restrictions, is a complex phenomenon that to date has not been fully described analytically. It is an area that received a great deal of attention because of its application to nuclear reactor technology. The majority of the work done in this area considered ideal geometries such as nozzles, orifices and straight pipes. In the area of control valves very little work has been done. Brockett and King 1 studied subcooled water. Stiles 2 looked at subcooled freon. Martinec 4 compared subcooled freon in valves with ideal geometries. Sheldon and Schuder 3) looked experimentally at air/water mixtures through valves that resulted in a sizing procedure. Fagerlund 10 presented an analytical model that required use of the Sheldon and Schuder data to establish the behavior of valves as opposed to more ideal geometries. However, the data used was limited to a single valve travel. Fagerlund and Storer 11 have expanded this to include several valve travels that further generalizes the technique. It is the intent of this paper to summarize a practical approach to sizing valves for two-phase service that may be reduced to either a graphical or calculator procedure. Discussion of Analysis A fundamental assumption in this method is that the quality remains constant between the inlet and the vena contracta. For gas-liquid flows it is obvious providing vaporization does not occur. This item ships from multiple locations. Your book may arrive from Roseburg, OR, La Vergne, TN. Paperback.
