Forgotten Books, 2017. Paperback. Condition: New. Language: English . Brand New Book ***** Print on Demand *****. Excerpt from The Dwarfmistletoes of California and Their Control To start a new infection the seed must become attached to the bark of a young branch on a susceptible host. On germination the germ tube (radicle) grows along the bark surface until it is obstructed by a bud or leaf base. At this point the radicle produces an irregular mound of tissue which functions as an anchor. From the under side of this mound of tissue the primary root-like haustorium develops. If the bark is not more than 3 years old, the haustorium can penetrate it to the cambium, Sometimes the haustorium penetrates thin older bark. From this primary haustorium other haustoria develop in the bark, constituting a new infection from which the aerial parts develop.
