

Towards designing elastic and magnetic properties of Co-based thin film metallic glasses

Filesize: 1.96 MB

Reviews

*Completely essential read book. I could possibly comprehend every little thing using this written e book. You wont sense monotony at any moment of your own time (that's what catalogues are for relating to if you ask me).

TOWARDS DESIGNING ELASTIC AND MAGNETIC PROPERTIES OF CO-BASED THIN FILM METALLIC GLASSES

Shaker Verlag Aug 2012, 2012. Buch. Condition: Neu. Neuware - The fact that metallic glasses combine both metallic properties and characteristics of amorphous materials lead to intensive research worldwide, exploring this interesting class of materials. Co-based metallic glasses, and $\text{Co}_{43}\text{Fe}_{20}\text{Ta}_{5.5}\text{B}_{31.5}$ in particular, offer the attractive combination of both high fracture strength and excellent soft magnetic properties. Within the framework of this thesis, the generation, validation and implementation of a first principles model for $\text{Co}_{43}\text{Fe}_{20}\text{Ta}_{5.5}\text{X}_{31.5}$ ($\text{X}=\text{B},\text{Si},\text{P},\text{S}$) metallic glasses are described. This model allows for the identification of valence-electronconcentration and size-induced changes in structure, elastic and magnetic properties and hence contributes towards a knowledge based design of metallic glasses in the future. Within the generated ab-initio model stoichiometric body centered cubic supercells are assumed as initial configurations. After annealing at 4000 K, all cells were quenched down to 0 K at different cooling rates and subsequently relaxed in terms of atomic positions and volumes. To validate this first principles model, density and elastic modulus as well as the pair distribution function and volume magnetization of sputtered Co-Fe-Ta-(B/Si) thin film metallic glasses were measured. The computationally obtained density and stiffness values as well as the theoretical pair distribution function of Co-Fe-Ta-B and the volume magnetization of the Si-containing alloy are consistent with experimental data obtained for thin films and with literature data. The infinite cooling rate to quench the molten alloy was determined to be sufficient. The implementation of the for Co-Fe-Ta-(B/Si) successfully validated first principles model was realized by analyzing short range order, charge transfer and the bonding nature by means of density of states, Bader decomposition and pair distribution function analysis. For $\text{Co}_{43}\text{Fe}_{20}\text{Ta}_{5.5}\text{X}_{31.5}$ ($\text{X}=\text{B},\text{Si},\text{P},\text{S}$) a clear trend of a decrease in density and bulk modulus as well as a weaker cohesion was observed as the valence electron concentration for the X...
