Excerpt: .cylinder, or the functions considered by Sturm in connection with the conduction of heat, by Thiele and Charlier in reference to probability, and by Hermite.f The two-dimensional functions seem to be new, but they are shown to be the equivalent in polar co-ordinates of the functions considered by Hermite (d /d x) (d/cy) e-l+:3 and the relations connecting the two types of function are obtained. It is shown in the paper that any function of x and 6 can be expanded in the form 22a imo)niW cos 7116, where (--)7ran, m= fforn(o mcom6dxd6, Jo Jo and a proof of the convergence and validity of the expansion is given in the case where/is independent of 6, with an indication of the extension to the general case. Hence a series is obtained giving a solution of the equation Liouville, I and II. + Comptes Rendus, vol. 58. V2w = dujdt, which reduces for t = ta to a function given all over the plane, viz.: -- -, m (o/0 B+1 w-, m(/4o) cos m6, the coefficient a, h m being obtained as above. This series is shown, by direct expansion, to be equivalent to Laplace s definite integral solution of the cooling of an infinite plate, viz., Various other expansions are given analogous to Neumann s expansions of Jn (r2+p--2rp cos #) in a series of Bessel functions. The last part of the paper considers the equivalent functions in Cartesian co-ordinates, in terms of which Hermite has...
