Not illustrated. 1916 Excerpt: .whether the complication of the additional apparatus is justified except in special cases. As previously stated, the resistance of the pipe can be definitely determined from the tables with an accuracy of about 10 per cent, and the extremely variable current that is usually found on pipes can hardly be averaged with greater precision than this. Moreover, since the millivolt drop being measured in any practical case is usually very small (generally less than i millivolt), quite appreciable errors would be introduced due to thermoelectromotive forces in the millivoltmeter circuit itself. A difference of 30 or 40 in the temperature of the junctions would produce errors amounting to several per cent or larger, and this difference might readily occur, especially in gas. pipes when the pipes are excavated and one terminal is more or less damp and others relatively dry. Further, the temperature coefficient of iron pipe, particularly wrought iron or low carbon steel, is very high, and seasonal changes in temperature of the pipe will produce variations of 5 to 10 per cent in the resistance. It appears, therefore, that accurate calibration of the pipe is very rarely justified in view of the complications of the apparatus required for this purpose. (c). Use Of The Direct-current Ratio Relay.--The use of the direct-current ratio relay for measuring current in conductors which can not be opened for the insertion of ammeters or shunts has only recently been employed. The ratio relay permits the measurement of variable continuous...
