## ZUR LEHRE DER BELEIDIGUNG VERSTORBENER

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 44 pages. Original publisher: Washington, D. C. : Congressional Budget Office, 2007 OCLC Number: (OCoLC)681752906 Subject: LASIK (Eye surgery) -- Practice -- Evaluation. Excerpt: . . . by doing in surgery. In this section we describe how ophthalmologists measure eyesight and explain how we use these measures in our analysis. Two different methods are commonly used to examine visual acuity: the Snellen and the refraction measures. For the first, the patient reads letters of different sizes from a distance of 20 feet. Snellen measures visual acuity on a scale from 20 10 to 20 800, depending on the letter 25 sizes that the patient can read. Although the Snellen measure is informative, ophthalmologists need to perform a refraction assessment in order to determine the refractive error and prescribe a 26 27 correctivelens. The results are expressed as sphere, cylinder, and axis. The sphere and the cylinder are measured in units called diopters and determine the lens prescription; the axis is 28 measured in degrees and signifies the direction of an astigmatism. A negative sphere indicates myopia ( near-sightedness ) and a positive sphere, hyperopia ( far-sightedness ). The higher the absolute value of the sphere, the worse the visual acuity. The cylinder reflects the degree of 29 astigmatism. A value of zero indicates a perfect sphere or cylinder, meaning that the patient 30 does not have myopia hyperopia or astigmatism. Ophthalmologists use a standard metric called the defocus equivalent to obtain a 31 composite measure based on the refraction measure of the eye. The defocus equivalent is obtained by the following formula: 25 The Snellen chart cannot measure visual acuity that is worse than 20 800. 26 Refraction refers to how light waves are bent as they pass through the cornea and...
