Excerpt: . . . fifth day of his illness he vomited a living a s c a r i s; three days later, after the administration of santonin, a second worm 25 cm. long was passed, and after large evacuations he recovered. Metchnikoff cites three cases showing distinct symptoms of appendicitis in which the patients, one of them a child twelve years old, were relieved by anthelmintic treatment, without operation. In each instance the eggs of both ascaris and trichocephalus were found in the stools. He justly lays stress upon the necessity for a microscopic examination of the stools for ova in all cases in which there is any room for suspicion, a measure especially important in children, in whom a slight intra-abdominal source of irritation may provoke violent symptoms with fever. The role of the worms may be to produce an erosion of the mucosa, and so...
